

Discover what matters most in your Atlassian environment.

Deeper than a generic health check. More focused than a comprehensive assessment.

A complimentary, expert-led evaluation of your Atlassian environment, or a bounded part of it. Senior Atlassian consultants work directly in your environment and finish with a readout of prioritized, actionable findings on governance, operational risk, efficiency and business value.

SEVEN DIMENSIONS WE LOOK AT

01	Governance and administration	Ownership, admin responsibilities, configuration discipline, change control
02	Configuration and maintainability	Custom fields, workflows, schemes, spaces, app landscape, duplication
03	Security and access controls	Permission patterns, identity controls, admin privileges, obvious gaps
04	Licensing and commercial efficiency	License utilization, Marketplace app overlap, avoidable spend, renewal exposure
05	Process and platform alignment	Representative workflows; mismatches between configuration and how work actually runs
06	Automation, AI and consumption	Automation inventory, errors and consumption, risky rules, Rovo and usage-based pricing controls
07	Adoption and business value	Usage indicators, reporting usefulness, capabilities you pay for but do not use

WHAT YOU GET

- **A maturity profile** across the seven dimensions on a five-level scale, with the evidence and limits behind each rating. Where we cannot judge, we say "not evaluated" rather than guess.
- **Prioritized findings** that stand on their own: what we observed, why it matters, and a practical direction for action. Every rating is tied to evidence.
- **A readout** with your sponsor and stakeholders, and a plain view of what, if anything, is worth doing next. If the evidence justifies no further work, we say so.

ILLUSTRATIVE FINDING · AUTOMATION & CONSUMPTION

Observation: Of 642 automation rules, 19 generated 78% of 1.9 million executions over 30 days. Seven of those showed recurring failures.

Impact: Concentrated consumption and repeated failures create reliability risk and exposure to usage-based charges.

Recommendation: Review the 19 high-volume rules first, resolve the recurring failures, assign owners, and establish consumption monitoring.

Figures are fictional, for illustration only.
See the accompanying sample readout.

HOW IT WORKS

- 1 Discovery**
Sessions with your sponsor and key stakeholders: purpose, pain points, and where the boundary sits.
- 2 Hands-on investigation**
A senior consultant follows the strongest signals rather than a fixed checklist. Read-only conduct, no production changes.
- 3 Prioritization**
Evidence is interpreted and ranked by a senior consultant.
- 4 Readout**
A working session to walk through the profile and findings and agree what you want to do with them.

FOCUSED BY DESIGN

- Broad coverage with selective depth, up to 16 hours of senior effort. Scope is agreed upfront; for large estates, one site, one instance, or one business unit.
- Not a comprehensive security audit, a migration assessment, or an organization-wide process review. Areas we could not evaluate are recorded as such in the readout.
- For organizations with a named platform owner or business sponsor who wants a clear view of where to improve.

GET STARTED

Curious what we'd find in your Atlassian environment?

Tell us about your environment and we will confirm whether a complimentary assessment is a fit. No cost, no obligation.
